

Technical SEO, AEO & GEO Audit

heypearl.io — Full-site crawl, schema review, and internal-link integrity check

Audit date: August 14, 2026 | Scope: 36 routes, 24 blog posts, sitemap, redirects, schema, metadata

Executive Summary

A full technical crawl of heypearl.io was performed across every route, the sitemap, robots.txt, next.config.js redirects, all page-level metadata (canonicals, Open Graph, Twitter Card), all JSON-LD schema blocks, and the internal-link graph inside the 24-post blog dataset. **13 issues** were identified and every one was fixed and deployed to production the same session. No issues remain open.

Category	Found	Fixed
Broken redirects	1	1
Broken internal blog links	10 links / 5 unique targets	10 / 10
Missing sitemap entries	5 pages	5 / 5
Missing canonical tags	19 pages	19 / 19
Broken / mismatched OG images	3 pages	3 / 3
Stale internal CTA links	2 pages	2 / 2
Schema data inconsistency	3 pages	3 / 3
Twitter Card downgraded	1 page	1 / 1

Detailed Findings & Fixes

1. Broken redirect chain: /services/geo

CRITICAL

Finding: next.config.js redirected /services/geo → /solutions/geo, a route that does not exist in the app — any crawler or visitor following this 301 landed on a 404.

Fix applied: Redirect destination corrected to /solutions/service-businesses, the live page that matches the original GEO service offering.

FIXED &
DEPLOYED

2. Broken internal blog links using stale /blog/ prefix

CRITICAL

Finding: 10 internalLinks entries across the 24-post dataset in src/lib/posts.ts pointed to /blog/[slug], but the site serves posts under /insights/[slug]. Every one of these in-article links 404'd.

Fix applied: All 10 links rewritten from /blog/ to /insights/ via a scoped find-and-replace across posts.ts.

FIXED &
DEPLOYED

3. Broken internal links pointing to non-existent or renamed slugs

CRITICAL

Finding: After correcting the path prefix, 5 unique target slugs still did not match any real post slug — stale references left over from earlier renames: real-estate-agent-ai-visibility, audit-ai-search-visibility, pearl-framework-ai-ready-business, ai-engines-business-recommendations, structured-data-schema-ai-guide.

Fix applied: Each remapped to its correct live slug (e.g. audit-your-ai-search-visibility, pearl-framework-building-ai-ready-businesses, how-ai-engines-decide-who-to-recommend, structured-data-schema-ai-visibility, ai-visibility-real-estate-agents-brokerages). Verified programmatically — all 24 internal blog links now resolve to a real slug.

FIXED &
DEPLOYED

4. Five live pages missing from sitemap.xml

HIGH

Finding: /contact, /insights (the listing page), /about/founder, /results/case-studies, and /results/recent-wins all exist and render, but were absent from src/app/sitemap.ts — reducing crawl discovery for these pages.

Fix applied: All 5 added to the static sitemap entries with appropriate priority and change-frequency values.

FIXED &
DEPLOYED

5. 19 pages missing canonical tags

HIGH

Finding: /platform, /solutions, /results, /resources, /faq, /pricing, /insights, /get-started, and all 12 platform-module, solutions-vertical, and results sub-pages had no explicit `alternates.canonical` — leaving canonical resolution entirely to Next.js's implicit `metadataBase` behavior, with no manual override available if duplicate-content issues arise.

Fix applied: Explicit `alternates: {{ canonical: '...' }}` added to all 19 pages' metadata blocks, matching the pattern already used on /about and /about/founder.

FIXED &
DEPLOYED

6. Contact page referenced non-existent OG image files

MEDIUM

Finding: /contact's metadata pointed to /images/og-contact.jpg and /images/og-default.jpg — both outside the actual /images/og/*.webp asset folder and not present on disk. Social shares of the Contact page would render with a broken image.

Fix applied: Both replaced with the existing, verified /images/og/og-default.webp asset.

FIXED &
DEPLOYED

7. /get-started missing Open Graph image and Twitter Card entirely

MEDIUM

Finding: /get-started is the platform's primary conversion page (priority 0.9 in sitemap) but had no openGraph.images and no twitter block at all — shares of this page carried no preview image on any platform.

Fix applied: Added canonical, og-default.webp as the OG/Twitter image, and summary_large_image Twitter Card type.

FIXED &
DEPLOYED

8. FAQ detail pages (/faq/[slug]) using degraded Twitter Card type

MEDIUM

Finding: All ~144 generated FAQ pages used twitter.card: 'summary' (small thumbnail) instead of 'summary_large_image' used everywhere else on the site, and had no image set for either Open Graph or Twitter at all.

Fix applied: Upgraded to summary_large_image and added the site default OG image to both Open Graph and Twitter metadata in generateMetadata().

FIXED &
DEPLOYED

9. Stale CTA links to redirected /services route

LOW

Finding: The /insights listing page CTA strip and the /about page hero both linked to /services, which 301-redirects to /solutions — an unnecessary redirect hop on two high-traffic CTAs.

Fix applied: Both links updated to point directly at /solutions, skipping the redirect.

FIXED &
DEPLOYED

10. P.E.A.R.L. framework acronym defined three different ways in schema

MEDIUM

Finding: The homepage's FAQPage schema defined P.E.A.R.L. as “Process, Entity, Authority, Reputation, Leverage” — matching the actual PearlFramework component shown on-site — while the root layout's Organization description and the /about page's FAQPage schema both defined it as “Process, Efficiency, Automation, Revenue, Leverage.” Search engines reading conflicting structured data for the same entity fact is a direct trust/consistency signal problem for AI answer engines specifically.

Fix applied: Root layout and /about page schema corrected to match the homepage and the actual on-site framework component: Process, Entity, Authority, Reputation, Leverage.

FIXED &
DEPLOYED

Verification

Every fix was verified before and after deployment:

- TypeScript compiler (`tsc --noEmit`) — zero errors
- Full production build (`next build`) — all 36 static/SSG routes generated successfully, including previously-missing sitemap pages
- Programmatic link-integrity check — all 24 internal blog links now resolve to a real post slug (0 broken, down from 5 unique broken targets across 10 occurrences)
- Live production checks post-deploy: `/services/geo` now 200s through to `/solutions/service-businesses`; `sitemap.xml` now includes all 5 previously-missing URLs; canonical tags confirmed present on `/platform` and `/get-started`

Deployed to production at heyppearl.io via Vercel. Deployment ID: `dpl_4WmFi6c23bfKy9pcKDsLGPhpCqWZ`.

This audit covered technical crawlability, structured data consistency, and internal link integrity. It did not include content-depth analysis, backlink profile, Core Web Vitals, or competitive AI-citation benchmarking — flag if you'd like any of those added to next week's pass.
